MONGODB

1. Install mongodb

https://docs.mongodb.com/manual/administration/install-community/

2. Import data into mongodb

- Run command line: brew services start mongodb-community@4.2
- Run command line in new terminal window: mongo
- Then run command line in terminal not in mongo:

  mongoimport --db dbName --collection collectionName --file fileName.json

You should change dbName, collectionName. These will be your database name and collection name. Then the filename.json will the address of you json file without " ".

After imported successfully. Just run "use project_name" in mongo. You can use "show dbs" to see existing databases.
